zorvyn fintech

Dear Kishan,

Welcome to the Zorvyn family. We are pleased to have you onboard as a **Cybersecurity Analyst Intern**. My name is **Mudiwa Mkonto**, and I will be your reporting manager throughout your tenure. We look forward to a productive and mutually enriching journey, where you will have the opportunity to learn, grow, and contribute fresh perspectives and innovative ideas to the team.

At Zorvyn, we specialize in fintech services, including Transaction Ledger, Financial Analytics, Cash Flow Forecasting, Accounting Software, Payment Processors, Audit Logging, and Enterprise Security. Given the sensitive nature of financial data and the regulatory standards our products must adhere to, security is a foundational priority across everything we build. Your role in identifying vulnerabilities, analyzing threats, and strengthening our security posture will be important in protecting our systems and the trust our customers place in us.

Our IT team is currently setting up your company email and Microsoft Teams account. Your accounts will be ready within 8 to 10 days, after which you will receive your login credentials for Microsoft Teams and your official company email address.

Your official start date is **13th April 2026**. During this initial phase of your employment, you will undergo structured training to develop the skills required for cybersecurity analysis, threat detection, secure system design, and the practices used across our security operations. This period is designed to help you become familiar with our systems and tools so that you can contribute effectively to the security team.

The first 15 days will be dedicated to training, and you will receive full compensation for this period. As we are compensating you during this time, we expect you to actively engage in the learning process, work diligently, and acquire the necessary skills to perform effectively in your role.

**Training Expectations**

Below are the key concepts and tools you should focus on during the next 15 days. You are encouraged to use online resources, official documentation, and tutorials to support your learning. This is an opportunity to build a strong technical foundation.

1. **Network Security and Protocol Analysis**
   Build a solid understanding of how common network protocols operate, including TCP/IP, DNS, HTTP, HTTPS, and TLS. Study how firewalls, intrusion detection systems, and intrusion prevention systems work to monitor and control network traffic. Learn how to use packet analysis tools such as Wireshark to capture and inspect network traffic, identify anomalies, and understand how attackers exploit protocol weaknesses to gain unauthorized access to systems.

2. **Security Operations and Threat Analysis**
   Learn how security operations centers function and how security analysts monitor, detect, and respond to threats in real time. Study the lifecycle of a security incident from initial detection through containment, eradication, and recovery. Understand how to work with security information and event management platforms to correlate logs, identify indicators of compromise, and prioritize alerts. Familiarize yourself with common threat frameworks and how they categorize adversary tactics and techniques.

3. **Cryptography and Public Key Infrastructure**
   Study the fundamentals of cryptography, including symmetric and asymmetric encryption, hashing algorithms, and digital signatures. Understand how Transport Layer Security secures data in transit and how certificates are issued, validated, and revoked through public key infrastructure. Learn about key management practices, certificate authorities, and how cryptographic protocols are applied in securing authentication flows, API communications, and stored data within enterprise systems.

4. **Web and Application Security**
   Learn about the most common vulnerabilities found in web applications, including injection attacks, cross site scripting, cross site request forgery, broken authentication, and insecure direct object references. Study how these vulnerabilities are exploited and what countermeasures developers and security teams implement to prevent them. Understand how to review application code and configurations for security weaknesses, how web application firewalls provide an additional layer of defense, and how secure coding practices reduce the attack surface of an application.

5. **System Security and Hardening**
   Understand how to secure operating systems and server environments by applying hardening techniques. Study access control models, user privilege management, patch management processes, and how to configure systems to minimize their exposure to attack. Learn about endpoint protection tools, host based firewalls, and how to audit system configurations against established security benchmarks. Familiarize yourself with the security considerations specific to both Linux and Windows environments.

6. **Basics of Reverse Engineering**
   As we are now focusing on software and data security, we are actively building tools to counter reverse engineering of our software through obfuscation techniques. An in depth understanding is not required at this stage, however we do expect you to familiarize yourself with the basic concepts of what reverse engineering is and what obfuscation is.

**What Happens Next**

Tomorrow, I will send you a separate email with your initial training tasks and detailed instructions. Within the next 5 to 6 days, you will have an online meeting with me and senior members of the project team. This session will serve as your orientation, where we will discuss your role and responsibilities, walk you through the project objectives, and hold a short discussion to address any questions you may have.

**Confidentiality Notice**
All information shared with you during your employment at Zorvyn is strictly confidential. Any unauthorized disclosure of company data, proprietary information, or internal processes will result in immediate termination of your contract.

We are glad to have you as part of the team and look forward to your contributions. Should you have any questions, please feel free to reply to this email. Alternatively, you may reach me at mudiwamkonto@zorvyn.live.

Once again, welcome aboard.

Best regards,
Mudiwa Mkonto
Senior Devops Engineer
Zorvyn FinTech Pvt. Ltd.

To: Mudiwa Mkonto - Zorvyn <mudiwamkonto@zorvyn.live>

Dear Mudiwa,

Thank you for the warm welcome.

I am excited to begin my journey as a Cybersecurity Analyst Intern at Zorvyn. I look forward to the training and learning opportunities ahead. I will start preparing on the topics mentioned and will be ready for the tasks.

Please let me know if there is anything I should do in the meantime.

Best regards,
Kishan N

Thank you, Kishan.

I will be sharing your training topics and initial tasks with you shortly.

In the meantime, please ensure you have completed the following.
Log in to the workspace portal at workplace.zorvyn.live and update your profile including bank details. Complete the welcome kit preference form if you have received it from the logistics team.

I will send you the learning topics, resources, and your first task soon. Please keep checking your email regularly so you do not miss any communication.
