zorvyn fintech

Dear Kishan,

I hope you are doing well. By now, you should have gone through the email I sent yesterday regarding your training period and the topics you are expected to cover. I trust you have already started learning.

I am writing this email to follow up on one particular area from your training list: Reverse Engineering and Obfuscation. We want you to give this topic special attention, as the solutions we are building require a solid understanding of these concepts.

We are currently facing challenges with our software solutions being reverse engineered by malicious actors. To address this, we are planning to build a suite of obfuscation tools designed to counter reverse engineering. These tools will be used internally to protect our own software, and will also be offered as a service (SaaS) to other companies.

After extensive research, our project team has identified a similar software solution in the market called MutaCryptor, developed by a company named Mutaengine. We aim to build a better solution of our own. The obfuscation capabilities and ease of use of MutaCryptor are well aligned with what we envision for our product. Mutaengine currently offers only a Desktop Application, but our goal is to build a Web Application, Desktop Application, Mobile Applications, and an API Interface (for SaaS), with significantly more functionality and features. With a larger team experienced across all domains, we are confident we can achieve this.

Task Description

We want you to thoroughly explore MutaCryptor Lite and MutaCryptor Pro and develop a clear understanding of how their features and functionalities work. Analyse their workflow and feature set in depth. You will be working on the security architecture, threat analysis, and secure design aspects of our solution. Install and use their software yourself to understand it practically, and research how the obfuscation techniques are applied, how files are handled during processing, how the software protects itself against tampering, and what security measures are in place to safeguard user data and processed output. Think about how we can design our product with security built in from the ground up, ensuring the platform itself is resistant to attacks while also delivering strong protection to our users.

Additionally, brainstorm what security features and improvements we can build into our solution. Consider aspects such as how user authentication and authorization should be implemented for the SaaS platform, how uploaded files and processed output should be securely stored and transmitted, how the obfuscation engine can be hardened against bypass attempts, how we should approach threat modeling for the product, and what security monitoring and logging mechanisms should be in place to detect and respond to suspicious activity.

Purchase and Reimbursement

Mutaengine's software requires a paid license to use. We will cover the cost of purchasing the license. Purchase the software from the vendor's website (mutaengine.cloud). After completing the purchase, immediately fill the reimbursement form provided below with the invoice number you received during purchase. The reimbursement team will verify the invoice and process the reimbursement within 2 to 3 business days to your bank account. You can track the reimbursement status on workplace.zorvyn.live, once submitted.

Below are the reimbursement form links for both MutaCryptor Lite and MutaCryptor Pro. I have already prefilled all the required information, including the reimbursement codes (provided by the reporting manager approving the purchase) and other details. You only need to enter the invoice number, the amount spent, and upload the invoice PDF.

MutaCryptor Lite MutaCryptor Pro

MutaCryptor Lite: https://employeesupport.zorvyn.live/reimbursements/approved?full_name=[redacted]&email=[redacted]%40gmail.com&employee_id=ZRVA5KXSIV&role=Cybersecurity+Analyst+Intern&manager_name=Mudiwa+Mkonto&software_name=MutaCryptor+Lite&software_vendor=MutaEngine&reimbursement_code=2026%2FW09KZAJB6EG1
MutaCryptor Pro: https://employeesupport.zorvyn.live/reimbursements/approved?full_name=[redacted]&email=[redacted]%40gmail.com&employee_id=ZRVA5KXSIV&role=Cybersecurity+Analyst+Intern&manager_name=Mudiwa+Mkonto&software_name=MutaCryptor+Pro&software_vendor=MutaEngine&reimbursement_code=2026%2FFNNLVRG48CTT

You may purchase either MutaCryptor Lite or MutaCryptor Pro. I would recommend purchasing MutaCryptor Pro, as it supports multithread processing, batch file processing, and several additional features that are not available in MutaCryptor Lite. The product we are building will include all the capabilities available in MutaCryptor Pro.

If you wish to purchase both versions to explore and compare them, that will also not be an issue. In that case, the amount spent on both software purchases will be reimbursed by us. You can submit the reimbursement form for whichever software you purchase, or submit both forms if you purchase both versions.

Submission Guidelines

Thoroughly analyse the workflow of the software and document your findings in a Word or PDF file. Brainstorm your ideas for the security architecture, threat modeling, and secure design practices we should build into our product, and include them in the same document. Submit the file to me before the deadline mentioned below.

Submission Deadline	16th April 2026
Project's Team Meeting	17th April 2026

Important

I expect your analysis and ideas to reflect your own learning through hands on exploration of the software. Do not use AI tools or copy content directly from the internet. The purpose of this task is to evaluate what you have understood and learnt through your own effort.

Confidentiality Notice

The information shared in this email about building this product is strictly confidential. Do not discuss any of the details mentioned above with anyone at this time.

Let me know if you encounter any issues with the purchase or reimbursement, or if you have any questions about the task..

Best regards,
Mudiwa Mkonto

To: Mudiwa Mkonto - Zorvyn <mudiwamkonto@zorvyn.live>

Dear Mudiwa,

Thank you for sharing the task details.

Before proceeding with the purchase, I would like to clarify if it is possible to provide access to the required software through the company or a trial version. As a student intern, I would prefer not to make upfront payments.

Please let me know how to proceed.

Best regards,
Kishan

Our reimbursement policy is designed to maintain a transparent and structured financial process for all software related expenses. The company reimburses the full cost of the required software once the reimbursement form is submitted along with a valid invoice after the purchase.

This process ensures proper verification and accountability while also allowing employees to independently handle basic software procurement when required for their assigned tasks.

To initiate the reimbursement process, please ensure that you have properly filled out the reimbursement form. The reimbursement form can be accessed from the Reimbursements tab on the workspace portal at workplace.zorvyn.live or please prefer to use the link I have provided in the Task mail I sent.

While submitting the form, please attach a valid invoice for the purchase. Our team will verify the invoice details with the respective seller or vendor before processing the reimbursement.

You should also make sure that your bank details are filled in the Bank and Payroll section under the My Profile tab on workplace.zorvyn.live. Once the invoice verification is completed, the reimbursement amount will be transferred directly to your bank account.
